Assuming that certain ground displacements along the tunnel circumference have occurred before the installation of the liner, analytical solutions of stresses and displacements are derived with particular emphasis on the seepage and the stress release effect induced by tunnelling. The proposed analytical model is validated by numerical simulation.

Measurements of horizontal stresses at civil and mining sites around the world show that the ratio  $k$  tends to be high at shallow depth and that it decreases at depth (Brown and Hoek, 1978, Herget, 1988). In order to understand the reason for these horizontal stress variations it is necessary to consider the problem on a much larger scale than that

and shallow arch curvatures are discussed below. The axial and bending stress resultants,  $N$  and  $M$ , consistent with Eq. 1 are expressed in terms of displacements in the following consti-tutive relations:  $N = EA R dv d - w M = -EI R 2 d2w d + dv d 2$  where  $E$ =Young's modulus and  $A$  and  $I$ =arch's cross-sectional area and the area's second ...
