each day. Now, let's define each Greek in more detail. Delta: The hedge ratio. The first Greek is Delta, which measures how much an option's price is expected to change per \$1 change in the price of the underlying security or index. For example, a Delta of 0.40 means that the option's price will theoretically move \$0.40 for every \$1 move in the price of

Theta — This Greek measures the effect that time's decreasing has on an option as it approaches expiration. This is also known as time decay. Theta quantifies how much value is lost on the option due to the passing of time. It is typically negative for purchased calls and puts, and positive for sold calls and puts.

Trading options without understanding Options Greeks is like flying a plane without the ability to read instruments. Unfortunately, many traders do not know how to read the Greeks. This puts them at risk of a fatal error, much like a pilot would experience flying in bad weather without the benefit of a panel of instruments at his or her disposal.
